Business BASIC III: Print Using

=====

The string specification in Print Using takes only as many characters of a long string as are required to fill its field length; hence, the rest of the string is ignored. This example:

```
A$ = "abcdefghijklmnopqrstuvwxyz"  
Print Using "3X,10A,3X";A$
```

```
returns:  
    abcdefghij
```

A\$ is truncated to 10 characters. Use the MID\$ function to split up a string into multiple lines.
