EDITORIAL

We have received a "Letter to the Editor" from Stephen E. Bach of Scottsville, Va. (a non-member who bought our newsletters from a computer store). He points out that in one of our issues we reprinted from three other periodicals without giving proper credit and/or indicating that we had obtained permission to reprint. We would like to thank Mr. Bach for bringing this to our attention. It is not our policy to reprint without giving credit or without obtaining advance permission when that is necessary. Our only excuse is that in the rush to meet a deadline we failed to meet this requirement.

Membership dues for Washington Apple Pi are \$12.00 per calendar year. If you are interested in joining our club, call our club number (301-468-2305) and leave your name and address. An application form will be mailed to you. Or if you prefer, write us at the above PO Box.

NOTICE TO ALL MEMBERS

Washington Apple Pi now has an official phone number, (301) 468-2305. It resides with our Treasurer, Bob Peck. If no one answers please leave a message on the recorder. During the week of our monthly meeting a message will be left on the answering device stating details of the meeting.

EVENT QUEUE

Washington Apple Pi meets on the 4th Saturday of each month. The next meeting is Saturday, March 22 at 9:30 AM at George Washington University School of Engineering, Tompkins Hall (room 206), 23rd and H Streets, N.W.

NOVAPPLE will meet at 7:30 PM on March 27 at Computerland of Tysons Corner. Mountain Hardware will demonstrate their product line. Washington Apple Pi members are also invited. The next meeting of NOVAPPLE will be at 7:30 PM on April 10 at Computers Plus in Franconia.

WANTED: Applesoft ROM card. Must have Autostart. Rich Wasserstrom. Office (202) 797-5860 (Wash. D.C.); Home (703) 893-9147 (N. Va.)

SEEN AND HEARD AT THE FAIRE

- Three boards for the APPLE to allow 80 columns and lower case on your TV monitor.
 - Super-terminal \$395
 - Videx \$345
 - Double Vision \$199 (Special)
- Lobo minifloppies w/controller \$ 450
- IBEX dual sided 8" drives \$1295 w/controller (1/2 megabyte)
- Microsoft's Z80 computer peripheral board that plugs into your APPLE for approximately \$349 and allows you to run CP/M and Microsoft Basic as well as your usual APPLE programs and peripherals (available in May).
- CP/A, a software package soon to be completed for APPLE II. (Being developed by the firm that prepared DOS 3.1 for Apple, Inc.)
- EasyWriter now is a family. Added are: EasyMover (personal electronic mailer) and EasyMailer (continuous letter writer). Also Professional EasyWriter.
- Rumors.....There's a dual 5 1/4 1.6 megabyte disk drive in your future. DOS 3.3 to replace 3.2.1 will make programs PASCAL compatible and allow approximately 140 K bytes on the Disk II.
- Fact.....APPLE II is not to become obsolete. Woz says he loves his machine. This implies upward compatibility with APPLE III.
- Forth 1.7 for the APPLE is now available (except for documentation). John Draper demonstrated his latest version at the Saturday lecture but had not been able to complete the documentation in time for the Faire. Wait a few months before ordering. Price will be around \$55.

minutes

The Washington Apple Pi meeting of February 23 was called to order at 9:35 by the Vice President. There was a short business session. Our Treasurer said that at the moment there are no more plans for group purchases. These require money in advance so it means waiting until four orders are received. By then most people are no longer interested. The remainder of the business session was devoted to a discussion of the upcoming meeting of the officers of the INTERNATIONAL APPLE CORE in San Francisco. Bernie Urban, who will be representing our club there, led the discussion. Some items of interest were: A need for revision of the dues structure, the consensus being that small clubs are getting the "short end of the stick" with the present proposed structure; How software from IAC is to be handled; The potential profit from Apple Orchard; Objection to APPLE Computer Inc. sending a free copy of Apple Orchard to each owner with a registered warranty.

The formal program was presented by Gerald Eskelund, on the subject of Lo-Res Graphics. He reviewed a book, "Introduction to Lo-Resolution Graphics" by Wadsworth. He demonstrated on the computer some of the programs in the book, and gave an explanation of how to develop the programs.

The meeting was adjourned to the hands-on computer session and to a question and answer session led by Hersch Pilloff. (See Hersch's article in our February issue regarding plans for making this a regular "meeting after the meeting.")

NOVAPPLE Minutes for February 13, 1980

The meeting was called to order by Nick Cirillo, the Vice President. The first order of business was to pass out copies of the proposed By-laws. All members were asked to read them carefully and be prepared to vote at the Computerland of Tysons meeting on February 28 or the Computers Plus meeting on March 12.

The Secretary was asked to see if we could get back issues of Washington Apple Pi. The problem with reproducing them is that they are on colored paper and do not Xerox well. The Secretary agreed to talk to the publishers about changing at least the inside to white.

At the next meeting at Computerland a discussion will take place on the various magazines and literature which are available for the APPLE owner. The idea is to let people know what is worthwhile to buy. The members are also reminded of the meeting at Computerland of Tysons on March 27. It will feature Mountain Hardware who will demonstrate their product line. Apple Pi members are also invited to attend. On March 12 a new tutorial will begin on Applesoft II. It

should offer something for both old and new members, as we will take on a problem to solve, building a program as we go.

The program for the evening was presented by Theron Fuller, our Program Chairman. He described a higher level language called Pilot. The language is often used in Computer Aided Instruction. It uses simple instructions and has built in error-trapping. This particular Pilot language was developed by Theron and is copyright protected. He offered to let any club member have a copy for his own personal use. The presentation was both informative and interesting.

NOVAPPLE Minutes for February 28, 1980

The meeting was called to order by the Vice President. The first order of business was to ask for comments and corrections to the By-laws. One correction was as follows:

ARTICLE I MEMBERSHIP
Section 2 Dues shall be set and approved by vote of the membership. Only one member of a household may vote for members of that household.

The Constitution and By-laws were approved by a show of hands with an unanimous vote. They will not become binding until voted on by the membership at Computers Plus as well.

A report was given to the membership by the Secretary concerning the Washington Apple Pi. He reported that changes were made in the last issue which allow us to reproduce copies at a later date. Some of the members asked that we make another suggestion. They would like the columns to be a little further from the left side since many of them put hole punches in to keep them in a binder. The Secretary informed the members that a membership list is now available. Everyone should check it for accuracy and put a yes or no in the margin by their name if they want their name given out to members or not. No list will be given out until the membership agrees, or names of those dissenting are removed. All attendees were reminded that if they have not paid their dues they will not receive Apple Pi.

The meeting continued with the program led by Gerald Eskelund. A whole series of magazines were reviewed and personal opinions as to their worth were offered. Comments were also given by the membership as to how useful they were for them. Some of the magazines reviewed were Byte, Creative Computing, Personal Computing, Recreational Computing, Micro, Call A.P.P.L.E., Softside, APPLE Version, Nibble, Apple Pi and Popular Electronics. Everyone seemed to enjoy the discussion and many of the members participated. One particular suggestion of note was that those of us who belong to or subscribe to magazines have a responsibility to all readers to complain if the material has many errors or is not of good quality. This is especially true of those organizations of which we are members. We should voice our opinion if we do not like the present policy.

The Source: An Information Utility

by Chuck Reinbrecht

- The Source: What Is It? -

Generically, it would be classified as a time-sharing service which users can access via a terminal. It offers the usual languages of Basic, Fortran and Cobol plus RPG, Pascal and assembly language. As a time sharing, service the Source also has an extensive library of both application and game programs. However, it has two characteristics that make it unique among time-sharing services. The first is low cost - at \$2.75 an hour for connect time (from 7 PM to 6 AM daily plus all day weekends and holidays). The second, and most important difference, is its orientation and wide variety of services. The Source describes itself as "An Information Utility" which is a much better definition than a time-sharing service. Let's describe the latter before reviewing the services that the Source offers.

- Time-Sharing: What and Why? -

The average time-sharing service offers access to a computer via a terminal on a dial-up telephone line. Connect charges generally run from \$10 to \$15 an hour plus charges for CPU time (for compute vs 'think' or typing time). In addition there is a charge for files stored on the computer's DASD (Direct Access Storage Device). Among the companies in this business are GE, SBC, Tymeshare and others. There is usually a minimum monthly charge of about \$100 to discourage small users. Customers may be small businesses without a computer or large businesses who do not have a computer that people can dial into. Why dial-up? Because the common denominator of most time-sharing is interactive problem solving --interactive in the language (Basic is the most common) but more importantly, interactive in the response. As a user I dial the computer, input my problem, and get an immediate response. Immediate may be seconds or many minutes depending on the job. But it sure beats sending my job to the DP department and wondering when it is going to be ready. Interactive in programming also, meaning that as a user I can do my own programming in a high level language such as Basic, Fortran, APL or Pascal. All time-sharing companies have application programs available for their customers. For APPLE owners, we have access to our own computer with most of the above advantages. In fact, the mini- and micro-computers are impacting time-sharing services to some extent now.

- Time-Sharing vs. APPLE -

Since a 'dumb' terminal costs as much as the minimum APPLE, why would one go to time-sharing. Memory size, speed, size of files, multi-user access (from the same organization), high speed lines (1200 baud and up), back up and other factors could

be critical requirements along with programming and application support services. These last items are probably the biggest hurdles to small business users with no computer knowledge that are concerned about committing all their business records to a computer. The limited support available from a computer store together with extremely variable quality and documentation of programs is a problem that micro owners are all too familiar with. To net it out, time-sharing can provide access to large computer power for sizable problems and/or allow the neophyte an economical, low investment startup for business data processing needs.

- The Source and Information Access -

With that background, what is unique about the Source, and for an APPLE owner, "What is in it for me?" Information, that's what's unique. Hersch Pilloff's article in the January newsletter indicated the need for information. In his case it was stock market price data. We read the NYSE, and other market closing prices daily in the newspaper but would like to access the data in computer readable form and to select our stocks. This is available from the Source on a daily, weekly and 1979 year-end basis.

- Source to APPLE Data Transfer -

The data in the Source is machine readable, but as an APPLE owner I would prefer to use my APPLE for analyzing the data. Also the APPLE disk is a logical place to collect, format and age the data. But how does the APPLE get modified from a 'dumb' terminal to a 'smart' terminal. Peripherals Unlimited (TCA099) provides a \$25 disk with programs that allow 'downloading' a Source file to an APPLE disk as a text file. The interesting point is that one would expect the Source to discourage this approach since it reduces the user's connect time. However, the Source is encouraging this approach to the extent that they are now the distributors for this program disk. It is a shrewd marketing move with the expectation that added services for the user are more important than attempting to limit data transfer to the user's computer.

- Electronic Mail: It Works -

The 'MAIL' facility of the Source has been a most useful and usable part of my use. Apple Corporation, Call A.P.P.L.E., INTERNATIONAL APPLE CORE, Muse, Peripherals Unlimited - all are on the Source and very responsive to questions. A user's directory with interests and State of residence allows one to scan for those with similar interests. I have found four Source users interested in APL for the APPLE. I haven't found an answer, but now there are four of us looking and aware of the others' interests. How would I have found four people with this interest out of 3000 without a computer search?

What does 'MAIL' offer for an Apple club? For computer stores? For INTERNATIONAL APPLE CORE? What are the needs for management of this capability in the areas

contd.

of filing, retrieval and search of text files? Electronic mail is here! Where will it lead? More on these questions as Apple Pi establishes a Source coordinator. To be part of this effort send 'Mail' to TCA257 for more details.

- Source Information Files -

UPI and NY Times news on national and international events as well as business and sports news. UPI syndicated features and a daily news summary are available.

National Real Estate Locator for those involved in moving, looking for vacation cottage, or investment potential.

Travel Information and Reservations including airline schedules.

NY Times Consumer Data Base.

Entertainment Guide including TV reviews, restaurant guide, special events in major US and foreign cities.

Daily Horoscope and Biorhythm Cycles.

For further information visit The Source at TCA, 1616 Anderson Road, McLean, VA 22101. Or call (703) 821-6660. They have a demonstration and classroom facilities there. Hours are 10 AM - 6 PM, Monday through Saturday.

- Growing Pains and Comments -

Growth has been very fast - over 3000 users in just over a year of existence. One result is degradation of response time, occasionally to the point of sheer frustration. Added computer power, with more to come, has improved this somewhat, but further improvement is much needed.

The stock data has occasionally had bad data and missing data. File access is slow and instructions are hard to remember, especially with multiple files for NYSE, ASE, OTC, averages, etc.

User instruction needs much work. There are guides available on the screen, but these need to be supplemented with printed guides to:

1. provide a concise summary of available files and commands,
2. allow reference in the middle of a procedure when going back to the instruction screen is not practical,
3. expose users to other services. It's a waste of time, and cost, to read long instructions dealing with service that turns out to be of no interest. For this reason, many users have probably not looked at all of the services available.

The user's manual for new subscribers is a good starter, but definitely needs to be supplemented on a regular basis.

The speed of transmission will have to be increased for a total service of this type to be effective. The 300 baud (30 cps) is far better than 100 or 150 baud, but it is still slow. One alternative would be to go to 1200 baud which is about the upper limit of an ordinary telephone line. This would increase modem costs and probably system access costs. Another approach

would be more concise instructions supplemented by printed manuals.

- In Conclusion -

The Source is a new entry into the world of information access that combines computer processing with data bases and electronic mail. There are enough different services available that almost every APPLE owner would be interested. For more information contact the Source, or the author. If you are already a Source subscriber, please send MAIL to TCA257 or join the Apple Pi Source Users Group.

Brain Teaser

Dear Editor,

Perchance I was working on machine #6 in the APPLE room after your last meeting. When I finished I found one abandoned diskette on each of the five machines to my left. Oddly enough, each was a different number from the Washington Apple Pi library. Being honest, I gathered them up to return them to their rightful owners. I queried the other people there and was able to accumulate some information. Knowing the intellect of your membership, I am quite certain that you should be able to figure out what belongs to whom.

1. Diskette #4 was found on machine #4.
2. The physicist was using machine #3.
3. John is a doctor.
4. Jeff had just bought Volume 5.
5. The programmer lives in Alexandria.
6. The lawyer had some problems with Volume 1.
7. Mr. Grant was on the accountant's left.
8. The person on machine #5 lives in Bowie.
9. Dick was on the second machine.
10. Mr. Carter just bought a home in Alexandria.
11. Mr. Bender was on the first machine.
12. Diskette #3 was owned by a resident of Silver Spring.
13. Mr. Wills, who resides in Rockville, was on Mr. Harper's left.
14. Diskette #4 was found on the machine to the right of where Mr. Grant was working.
15. Henry was working three machines to the right of where diskette #3 was found.
16. No one could tell me who had diskette #2 nor could they tell me Mike's last name nor who lived in Washington, D.C.

(Solution on Page 5.)

Creating Data Statements

by Theron Fuller (NOVAPPLE)

This program demonstrates how to create data statements from variable arrays within a program using text files. The program is written in Applesoft, but the technique can also be used with Integer Basic programs.

The data statements created by this technique can be appended to any program by loading the program, then executing the text file they are stored in. This can be used as a Rube Goldberg method of chaining programs. By creating data statements and appending them to other programs, Integer programs can be chained to Applesoft programs and vice versa.

UPDATE FOR D.C.HAYES MICROMODEM OWNERS

by Tom Jones

The Washington Apple Pi's "meeting after the meeting" on February 23 turned out to be a very informative session. During this general question and answer session, I discovered that a surprising number of members own a D.C. Hayes Micromodem. I also realized that some members who have the older Second Edition Owners Manual (May, 1979) never received the corrections on the typos in the the example programs.

I am making available a copy of this errata sheet, which might benefit these owners. In addition, there is a copy of Application Note No. 1 which was released sometime in the last few months. It contains an example to assist automatic log-on to a timeshare computer and an improved self-test program for the Micromodem II. This may also be helpful to the Micromodem II enthusiasts. Copies of either or both will be available at the next meeting, or by mail from the editor for the cost of the postage.

Hello APPLE II Plus

by Tom Jones

If you are an owner of an APPLE II Plus, you are aware that most programs available for the APPLE are written in Integer Basic. This is especially true for the ones you like the best! For me, these seem to be the utility programs. I have developed a short 'Hello' program written in Applesoft Basic which converts the DOS catalog display into a menu for program selection and execution. This program displays the disk catalog and then identifies each file with a letter, so that the user can select the program he wishes to run by entering only the letter. I must admit, the idea is not mine, but the logic is.

Upon not-so-close examination, the purist out there will certainly conclude that the program can be written more efficiently using multiple commands per line, no remarks, SCRNL functions, more POKES, etc. But my intent was to write a program in a straight forward manner with meaningful variable names, many remarks and one statement per line so others could follow it easily (I hope) and customize it as they like.

Since the program reads what is on the screen, it has limited value for disks that have more than 22 programs (i.e. one line for each program file displayed, plus two prompting lines). But most of my disks have long program names rather than long catalogs, so I find this program very useful.

One additional note, the program is designed to work with the standard APPLE II DOS catalog label "Disk Catalog nnn". Therefore, if you have modified this label and it does not contain a blank in position five, you must modify the program (around line 4040) to sense the first line of the catalog which identifies a file.

EXPANDED GRAPHICS DUMP
FOR THE IDS-440 PRINTER

ROBERT N. BOLSTER
NOVAPPLE

Did you try the hi-res screen dump routine listed in Hersh Pilloff's article in the December 1979 Washington Apple Pi? Were you disappointed by the small size of the printed picture? Here is a routine which will expand the picture to twice that size. Unfortunately, the printer can't print quite that wide, so only 7/8ths of the width can be used. The routine permits cropping either or both edges.

This routine was written for an Apple II with disk using the same I/O interface to the "Paper Tiger" printer. It will run in an Apple with enough RAM to allow use of high-res. page 1.

Three programs are used, "EXPANDED DUMP" in integer BASIC, and "EXPANDED DUMP.B" and "DRIVER" in machine language. The BASIC program will load the other two and the picture for you if needed. A picture from page 2 may be printed by saving it on the disk or by moving the data (* 2000<4000.5FFFM). Lines 270 to 310 calculate the starting addresses of consecutive lines of the picture in memory. Lines 340 to 360 produce masks used for vertical doubling. The first machine language program is provided as an assembler listing and as machine code. The printer driver is essentially the same as that in the December Apple Pi article; written by Darrell and Ron Aldrich and originally in the April-May 1979 issue of Call-A.P.P.L.E. (reprinted in the November issue of the Washington Apple Pi).

Thanks to Samuel S. Cottrell for the program (Washington Apple Pi, October 1979) which produced the beautiful sample picture.

"OH, I'VE GOT THE RESET BLUES"

Sorry I haven't been to a meeting in a while but life is life. Anyway, back on the subject.

Oh, I've got the reset blues. That's the number one hit around in Appleland. How many times have you users been in deep concentration, writing the program to beat all programs and you reach over to hit the ol' return key, when you hear the familiar 'beep'. Pow! Feels like you've been knocked to the floor by a left cross, doesn't it? Well, there are many ways to remedy the problem. The first and most inexpensive is taking your trusty pliers and pulling that dastardly reset key right off of there. (It's neat, it's clean, it's inexpensive, you don't have to make hardware changes and it won't break your machine or cause it to stop working.)

The next two ways involve a bit of cash. The first way is to buy a ResetGuard@ from Softape@. This little board is installed into your keyboard socket on the APPLE. The keyboard ribbon is stuck into a socket on the ResetGuard@. The board has a timed one-shot circuit that looks at the reset when it is depressed. To reset the machine you just press reset twice in one second (beep-beep). The ResetGuard@ sells for \$34.95 from Softape@, 10432 Burbank Boulevard, North Hollywood, CA 91601.

The second hardware reset is plugged into the Game I/O. Then your paddles or what-have-you are plugged into a socket on the reset protect. A wire is run out of the back of the machine and ends at a 3-position switch. When this magic switch is in the down position the reset acts regularly. When the switch is in the middle position the reset key is bypassed and you just simply flick the switch to the top position to reset Mr. APPLE. (The switch is spring loaded and it snaps back into the middle position.) This little wonder is available for \$29.95 from Computer Solutions, 5135 Fredericksburg Rd., San Antonio, TX 78229.

@ = Copyright.

(Editor's Note: We are pleased to have A Greenapple contribution and hope that it will become a monthly habit.)

FOR AMATEUR RADIO ENTHUSIASTS

The following is from the March 1980 AMRAD Newsletter. "APPLE Computer owners can now exchange questions and answers through the APPLE Computer Net, Sunday at 0100Z on 14329 kHz. Thanks HR Report."

I.A.C. Report

by Bernie Urban

INTERNATIONAL APPLE CORE is off to a promising start. The first issue of the Apple Orchard is out and will be available to members for \$1.00 at our next meeting. Those of you unable (or unwilling??) to attend may send a check for \$1.00 plus 50 cents postage to our P.O. Box and one will be sent by return mail. Additional copies may be purchased for the same price as long as they last (dealers excepted).

I attended the IAC meeting in San Francisco on March 13 as your representative from the Eastern Region and interim Board member. The first order of business was to caucus all representatives of member clubs in attendance from our Region to elect two official Board representatives. Dr. Tony Cerreta from New York Big Apple Users Group and I were elected to office. At a subsequent Board meeting a coin toss resulted in my retaining office for one year and Tony for two. You may remember that IAC had planned to set up alternating two-year terms for Directors except for the first year.

The new officers for all regions include:

West	Fred Wilkinson-San Francisco Apple Core
	Joe Alinsky -Original Apple Corps
North	John Lawrence -Michigan Apple Computer Club
	Harlan Felt -Illinois Apple Users Group
South	Scott Knaster -Denver Apple Pi
	Jerry Vitt -Dallas Apple Users Group
East	Tony Correta -Big Apple Users Group
	Bernie Urban -Washington Apple Pi
Canada	Auby Mandell Toronto Canada
Europe	Wolfgang Dederichs Hattingen Germany
Aust-ralia	Neil Bennett Sidney Australia

The newly elected Board members then caucussed and elected the following IAC officers:

President	Ken Silverman San Francisco Apple Core
Vice President	Mike Weinstock Suffolk Apple Comp. Soc.
Secretary	Joe Budge Carolina Apple Corps
Treasurer	Dave Gordon Original Apple Corps

We recommended to the officers that they consider Val Golding for the office of Editor of the Apple Orchard. This was subsequently passed and the Board received

Val's proposal for producing the journal. The Board voted to accept this proposal with some modification which was acceptable to Val. Some of you may want further details. If so, come see me. Val will serve as Editor for eighteen months beginning this July. He shall publish six quarterly issues during that period.

Ken presided at a general meeting to discuss IAC organization including the Constitution, By-laws and policy recommendations. There were approximately 500 attendees with a surprising number of participants from regions other than the Western Region.

Some of the decisions reached were:

1. Neil Lipson will continue as Software and Dick Sedgewick as Kit Committee Chairmen.

2. Ken Silverman will act upon recommendations from the general audience and from the Board and will prepare a revised Consitution and By-laws to be distributed to the Board members for review and approval.

3. Craig Vaughn, President of Peripherals Unlimited will serve as Telecommunications Chairman.

4. Mark Robbins of Novation will head the Standards Committee and Terry Taylor of Denver Apple Pi will be Librarian.

5. Yet to be named are Chairpersons for the following committees: Information Transfer, Technical and Annual meeting. My motion did not pass to hold the next meeting in Washington, D.C. concurrently with the National Information Conference and Expo (NICE V). Reason - too small a conference. The Eastern Region has however been commissioned to look into possibilities for Boston and alternatively we shall look to Chicago as a second possibility.

6. Until the Chairman for the Information Transfer Committee is found and approved, the Secretary Joe Budge of North Carolina will be the information center for IAC and will use the Board of Directors as information nodes.

7. The distribution of IAC software has begun. I have released the first disk to Dave Morganstein and he will have copies available at cost of preparation to members. IAC is planning to have for this first year one disk per month available to all member clubs at no cost. How the member clubs distribute copies to individuals is up to each club.

8. IAC is to continue to be a club of member clubs with \$50 as the annual membership regardless of size of club. Any newly formed club wishing to join will be required to pay a \$50 initiation fee as well. Each club will be entitled to one vote per year for a representative for their region.

9. Sponsoring membership to corporations will go for \$200 annually. Associate memberships were not discussed.

10. No decision was reached concerning

A PAGE FROM THE STACK

LIBRARIAN'S CORNER - Dave Morganstein

This month I'll vary the format a bit. First a plea for help in reviewing Library Disks. Anyone who wants to describe one of the disks should feel free to write a brief summary of each program. Rate them if you like for complexity or unusualness.

Below we have two things. First is a catalog of Disk 10. This is a business, math and statistics package with many common and useful (albeit short) programs. Second is an abbreviated description of how to use the TED II+ text editor/assembler on utility Disk 8. The basic writeup comes straight from the WOZPAK Produced by Call A.P.P.L.E, a worthy organization which offers exceptional information and software as an aside. I have recently used their Program Line Editor which, for \$20.00, is a tremendous deal. I encourage anyone who writes software, no matter at what level, to get a copy. There is a version for both Integer Basic and Applesoft.

Back to TED II+. The instructions describe the EXEC and TED modes. The EXEC is used for DOS related function and the TED for actually editing and assembling source code.

Enjoy!!!

Remember, Uncle David wants your contributed program....

TED II+

There are two modes of operation used, EXEC and TED. The prompt character for EXEC is '%' and ':' is the prompt character for TED mode. The EXEC mode provides the interface for all disk functions.

EXEC Commands

- C** :DISK CATALOG
Displays disk catalog. Source files are saved by TED II+ as <NAME>.S" Hit any key to return to EXEC menu.
- D** :DIRECT COMMAND TO DISK
Allows direct access to DOS without leaving the program. For example, "CATALOG,D2" will set drive #2 as the specified disk drive.
- L** :LOAD FILE FROM DISK
Loads existing source file from disk. <NAME> should not include ".S".
- S** :SAVE FILE TO DISK
Source file will be saved to disk with <NAME> provided by user. TED II+ will provide ".S" subscript.
- A** :APPEND FILES (CREATES '-A' FILE)
Loads two existing disk files, puts them together, and saves the new file to disk in one operation. User is asked for 'ORIGINAL FILE' and 'FILE TO APPEND'. The new file created will be '<ORIGINAL FILE NAME>-A', and the other files will be unchanged. The new file will also be in memory.
- T** :ENTER TED II+ EDITOR/ASSEMBLER
This shifts operation from EXEC mode to TED mode.
- Q** :QUIT TED II+
Exits the program when 'Q' is entered in EXEC mode. A 'Q' entered while in TED mode will return control to EXEC mode. Should you accidentally exit the program, 'RUN' (RETURN) will restart without losing the source file in memory.

Should you change your mind, the D,L,S, and A commands can be aborted with a carriage return.

TED Commands

These are direct commands. Note the upper and lower case letters of the commands. Those letters in upper case are required; the lower case letters are optional.

Add

Puts user into 'Add Lines' mode. If a source file is in memory, 'Add' will start with the next available line number. If not, it will start with 'Line 1'. Add is terminated with a CTRL-D as the first character on the line.

Insert I<line#>

Operates like 'Add', except lines are inserted into the source file starting at <line#>. Also terminated with a CTRL-D. Lines after the insertion line are automatically renumbered. Lines may be inserted before any existing line.

The following commands allow the user to

specify the range or ranges of lines upon which the command will act. If no range is specified, the entire file will be acted upon. A range may be a single <line#> or '<line#>,<line#>'. In addition, multiple ranges may be specified as '<range>/<range>' using "/" as a delimiter.

Delete D<line#> or D<range>

Deletes line or lines specified. The remaining lines are renumbered. Be sure to specify the ranges from highest to lowest. Otherwise, the wrong lines will be deleted! 'Delete' requires a <line#> or a <range> as part of the command.

Find F<range>"<string>"

Locates and prints all lines in which <string> occurs. If a <range> is specified, only that range will be searched.

Change C<range>"<s1>"<s2>"

Provides selective substitution of <s2> for <s1>. When Change command is entered, user is asked if "ALL OR SOME (A/S)" occurrences are to be changed. If 'ALL' is chosen, <s2> will be substituted for <s1> at every occurrence of <s1> within the range, if specified. Each line is displayed as it will appear with the change made. If the user hits the 'ESC' key, the change will NOT be made in that line. Any other key will allow the change to be made. Be sure to enter the " as shown in the example.

COPY COPY<1#1>,<1#2> TO <1#3>

Copies the range of lines specified by <1#1>,<1#2> to BEFORE <1#3>. After the move is made, the original lines (while possibly renumbered) are not deleted.

Edit E<range> or E<line#>

Each line to be edited is printed on the screen with the cursor at the beginning. Editing of lines is accomplished with the following controls:

- (RETURN) Accept the line as it appears on the screen.
- CTRL-D Deletes the character under the cursor.
- CTRL-I Inserts character(s) into the line at the cursor position. Terminated with a space, a forward arrow or a (RETURN).
- CTRL-F Moves the cursor to character entered after 'CTRL-F'. (find)
- CTRL-Q Accept line from beginning to cursor position.
- CTRL-R Restart editing of current line with previous changes deleted.
- CTRL-X Exit editing mode.

The forward and back arrows can be used to position the cursor on the line being edited. CTRL-U and CTRL-H can be used for cursor moves, also.

List L<line#> or L<range>

Lists the line(s) specified. If no <range> is specified, the entire file will be listed. The listing can be stopped at any time by hitting the space bar. The list will advance one line each time that the space bar is hit. Any other key will continue the listing. CTRL-C will abort.

General TED II+ Housekeeping Commands:

HImem: HI:<decimal#>
Sets highest memory limit for source and symbol tables.

LOmem: LO:<decimal#>
Sets lowest memory limit for source table and performs a NEW. Normally set to 7424. If LOMEM: is set below this point, TED II+ may overwrite itself.

NEW
Deletes existing source file. NEW does not reset memory limits.

IN#
Same as Basic IN#, but pretty much useless. A CTRL-C exit from listing or an 'END ASSEMBLY' resets to IN#0.

PR#
Same as Basic PR#. Quitting to EXEC resets to PR#0. This command is used for hard copy listing of the source file. PR# is also a 'PSEUDO-OP', as discussed in that section, and is used as such for hard copy assembly listings.

LEN
Provides display of size of source table and remaining memory available.

TABS TABS<col>/<col>/<col>" "
TABS is used to set tab stops for listing the source file. <col> is the decimal column of the stop. The quotes are used to define the tab character (a space).

LOAD
This LOAD command is available for non-disk systems. It loads a source file from tape.

SAVE
Saves source file to tape.

Note for non-disk users: TED II+ can be saved to tape as a machine-language program. After loading and running this Integer Basic version, exit the program and go into Monitor. Save it to tape with "800.1CFFW". The Cold Start entry is \$800; Warm Start is \$803. (A warm start does not reset source pointers, thus source is not erased on reentry.)

An instruction line entered into the source file consists of four parts:
LABEL...OPERATOR...OPERAND...COMMENT
If the label field is not used on a line, a space must be entered in this field. The remaining fields are separated from each other by a space each. An asterisk '*' entered into the label position on a line is used for Title or Comment lines. On single byte op-codes (i.e. ROL,ROR,etc), a";" can be used in the operand field so that comment indexing is maintained. No space is needed between '; ' and <comment>.

PSEUDO-OPS

TED II+ supports all 6502 mnemonics, Sweet-16 operators, and its own pseudo-operator set:

....ORG....\$<addr>
Sets address where final program will run. Object code may be actually written elsewhere, but is written to run at the specified address.

....OBJ....\$<addr>
Specifies starting address where object code is actually written. The default address of OBJ and ORG is \$7000 on a 48K APPLE II. (\$5000 on a < 48K APPLE.)

<label>....EQU....<expr>
Assign value of <expr> to <label>. <expr> is used for a decimal value <256. '\$<expr>' is used for hex addresses or constants. Zero-page addresses may be expressed in decimal, if desired.

....DS....<expr>
Reserves <expr> number of bytes at the location of DS in the program. <expr> may be decimal or hex (\$<expr>).

....DA....<label>
Stuffs address of <label> into memory, low byte first, then high byte.

....DW....<expr>
Stuffs hex equivalent of <expr> into memory. <expr> may be any legal type of expression.

....HEX....<hex bytes>
Writes listed hex bytes into memory. Only first 3 bytes will be listed during assembly. Use 2-digit numbers (3A01FF) etc.

....ASC....'<string>' or "<string>"
Writes ASCII characters of <string> into memory. If <string> is delimited by ', then high bit of character is clear. If # is used, high bit is set. Only the first three bytes stored will be printed during assembly, but all characters are written into memory.

....DCI....'<string>' or "<string>"
Similar to ASC, except the last character will have the high bit clear or set OPPOSITE of that set by choice of ' or "#.

....PAG....
Clears screen or form-feeds printer.

....LST.<ON> or <OFF>
Turns assembly listing on or off as specified. Any portion or all of the listing may be turned on or off with this command. Default is 'ON'.

....PR#.<expr> or \$<addr>
Sends assembly listing to Slot #<expr>=1-7. If '\$<addr>', listing will be sent to routine at <addr>.

....END....
Optional operator signaling end of source file. Assembler will stop at END. If target labels or EQUs are located after END, errors will occur.

TED II+ also accepts:
....BLT....<label>, branch less than.
Same as BCC operator.
....BGE....<label>, branch greater than/
equal. Same as BCS operator.

Legal Immediate Operands are:
('#' is used to signal Immediate)
#<LABEL> Low byte of LABEL address.
#>LABEL High byte of LABEL address.
#"<chr> ASCII of <chr> High bit set.
#'<chr> ASCII of <chr> High bit clear.
#<num> Hex number.
#<num> Decimal number.

Operands may be modified with the arithmetic operators: '+', '-', and '*'. These are one-byte modifiers only.

ASM is the direct command given to TED II+ to start the assembly process. If the list option is on, the assembler will halt at any errors detected. It stops at the line BEFORE the line with the error in it. Hitting the space bar will advance one line each time it is hit. Any other key will allow the assembler to continue running. A CTRL-C will exit the assembler at any time. Also, during assembly, the space bar may be used to temporarily halt the listing for examination. Any other key will continue assembly.

Any errors detected during LST OFF will not halt the assembler and will be displayed. A CTRL-C will exit the assembler at any time.

At the completion of assembly, the number of errors (in decimal) will be shown, as well as the number of bytes generated. This number does NOT include memory saved with the DS op-code. So take that into consideration when "BSAVE"ing the object code.

CREDIT WHERE CREDIT IS DUE DEPT.

This version of the Editor/Assembler represents a major overhaul of earlier version of TED II, due to the efforts of Gary Shannon, Andy Hertzfeld, and Neil Konzen. The Integer Basic EXECUTIVE part of the program was based on some routines from an EXEC program written by Andy Hertzfeld. It was added to, subtracted from, and ended up as the EXEC front end that is presented.

IAC REPORT contd.

the cost of subscriptions to the Apple Orchard (possibly to remain at \$1 per member per issue).

11. I recommended that a new committee be formed to prepare and conduct courses on the APPLE. This was approved by the Board, and Scott Kamins is to prepare a proposal to be submitted to the Board for our disposition. Tentatively the plan calls for up to six courses to be given by Scott each year in different parts of the country. A typical course may have ten 2 1/2 hours sessions over a two-week period and cost a member approximately \$200.

12. Board members and officers will be interconnected via the SOURCE, MicroNet and SPRINT. This is to expedite the conduct of official business.

13. A hot line will be established to augment the one provided by APPLE. How and when remains to be determined.

The IAC meeting held on Saturday was videotaped and copies will be made available to member clubs (at ? cost) so that you may hear the word on APPLE II from Steve Jobs, Steve Wozniak and Phil Roybal. Sue Eickmeyer should be able to schedule their viewing soon.

ECONOMICAL DISKETTE FILING

by Chuck Reinbrecht

If you are looking for an economical and effective way to keep your diskettes neatly filed and accessible, then try your local variety store. For \$1.20 you can buy a plastic box for 4 by 6 in. index cards. Cut the top off with a sharp knife and you have a stand-up holder for up to 30 mini-floppies. If you want a top that closes, for \$1.60 buy a box for 5 by 8 in. index cards. Cut a piece of cardboard to keep the floppies from sliding sideways and you have a filing/storage box that can be closed. Have more floppies? Buy two 4 by 6 in. and tape or glue them together to hold up to 60 diskettes. By cutting separators from light cardboard, you can index your files by subject, type or application. To keep out dust, I file my floppies upside down with the paper sleeve up. By putting a label on the sleeve my floppy indexing is improved. Try it, you'll like it!

HELLO APPLE II PLUS contd.

COMPUTERS PLUS, INC.

6120 Franconia Road, Alexandria, Virginia 22310 703-971-1996

COMPUTERS PLUS, INC. carries a broad line of Micro Computers and peripherals as well as one of the largest book selections in the area.

Hours: 10:00 am - 9:00 pm Mon-Fri
10:00 am - 6:00 pm Saturday

Soon to be offering classes and seminars on all aspects of microcomputing.

Authorized dealers for: APPLE
Cromemco
Dynabyte
Micropolis
Northstar
soon to add: Thinker Toys

Authorized service: APPLE

"The Plus Makes the Difference"

 WASHINGTON APPLE PI
 ORDER FORM

Washington Apple Pi now has a program library, and disks are available for purchase by anyone. These disks are chock full of the newest programs - the utilities are especially new and useful - many have not yet been seen in this area! The games are some of the best - not just simple and uninteresting ones. You may pick them up at any meeting or have them mailed for \$2.00 additional. They will come in a protective foam diskette mailer, or if you order 5 or more diskettes you will receive a sturdy plastic diskette holder/stand.

Also available for purchase by members at a discount price is the new APPLE II REFERENCE MANUAL (replaces the Red Reference Manual). The price of this manual is \$17.00. You may pick it up at a meeting or have it mailed to you at no extra charge.

	Amount
1. New APPLE II REFERENCE MANUAL - \$17.00 each	-----
2. PROGRAM DISKETTES-\$5.00 per disk picked up at meeting \$7.00 mailed to you...	
1. Volume 1 Utilities	-----
2. Volume 2 Utilities	-----
